

Parrot Minikit Smart

Overview: The Parrot Minikit Smart maintains an enviable audio standard in hands-free calling. The Minikit designed to hold and charge a mobile or smartphone does not bar the consumer from making calls as it offers a Phone book syncing facility and call initiation through voice commands over the Bluetooth speakerphone. The sturdy smartphone windshield mount is aimed to act as cradle to your handset for the purpose of charging. If you are in a comparative study, MiniKit Slim will appear a water-down version of Smart.

Features: The interior of the Minikit has been crafted with the taste of an aficionado. While the chassis is wrought on metallic substances, the panel feels soft. The moment you open the kit, will be taken in by the spring-loaded arm with foam pads that is capable of holding any average size mobiles and smartphones. Be it a massive Motorola Droid X or any other bar-style iPhones, the cradle will accommodate them without the least application of pressure. Minikit's physical controls below the dock consist of knob to confirm selection and a pair of buttons meant to accept and end calls. The two USB ports for connection are placed on the unit's right side.

Lest the audio quality falls in wireless connectivity inside a car, the Minikit provides you with a popped-out microphone with a retractable 2-foot wire and you can go talking over the microphone while sitting on the driver's seat. This device is more useful if you are in convertible or other hoodless cars.

The design has cut across all bounds. Look at the loudspeakers and a connection point for the mounting arm on the backside of the Minikit. Sounds pretty usual? Not for sure, when these two elements are clung to the chassis with the sole might of a magnet and a friction clip. The ball-jointed neck of the mounting arm allows the cradle to be positioned in a portrait or landscape form. To invest a few words on the speaker, it is sufficiently loud and human speech or turn-by-turn spoken directions are quite good to hear in playback.

Verdict: If your busy life forces you to look out for hands-free conversation device via Bluetooth, Minikit Smart should be the one to occupy your imagination because it is compatible with almost all of the navigation softwares (e.g. android, Symbian, iOS, Blackberry etc) used in smartphones today. You can keep on your hands-free conversation and navigation at the same time.
