It would as well allow one to become part and parcel of the relative action rather than just being stuck behind some camera feature. One doesn't require any secondary LCD for generating these features; however, it would still be of great assistance in assisting to frame up shots and give the taker a very stable platform to frame up intakes and familiarize with the process well in advance for momentous results.

The Duo has been structured to represent basic mini-camcorder which also consists of many other basic extra features. Though the clip quality may not be exceptional, it is still right on track for achieving its deliberate purpose. Some users have also pointed out that video quality may as well be worthwhile so long as subjects don't move around frequently while recording is being done. The camera also comes with an attachment HD camcorder which costs several hundreds more. When making shots at 1080pixels, most clips are usually very sharp & quiet detailed.
